

Description of Seoul Stay Custom Date Scheduling Syntax

-	Range of values	1-5
*	Any value in range	*
,	Value list separator	1,2,5

Fields can be comprised of the following values:

Single Input

Single inputs are basic numeric values which designate a specific time. For example, 1 in the “DayOfWeek” field would designate Monday.

Range

Ranges consist of two values separated by a dash. Every single value between these two values is represented by the range. For example, a range of 1-3 expresses all the numbers between 1-3, including both 1 and 3.

Any - *

An asterisk (or a star) - * - represents all the possible values in a range for the field. For instance, an asterisk in the "DayOfWeek" field represents all the possible inputs for said field, or in other words, every day of week.

List

Lists are a series of different values or ranges separated by commas (e.g. 1, 10, 15-19). If you wish to schedule a task for, let's say, both Sunday and Thursday, then you could use a list. As evident in the example, you can use a list to combine single values with ranges.
